1) Execution time does not determine efficiency of an algorithm

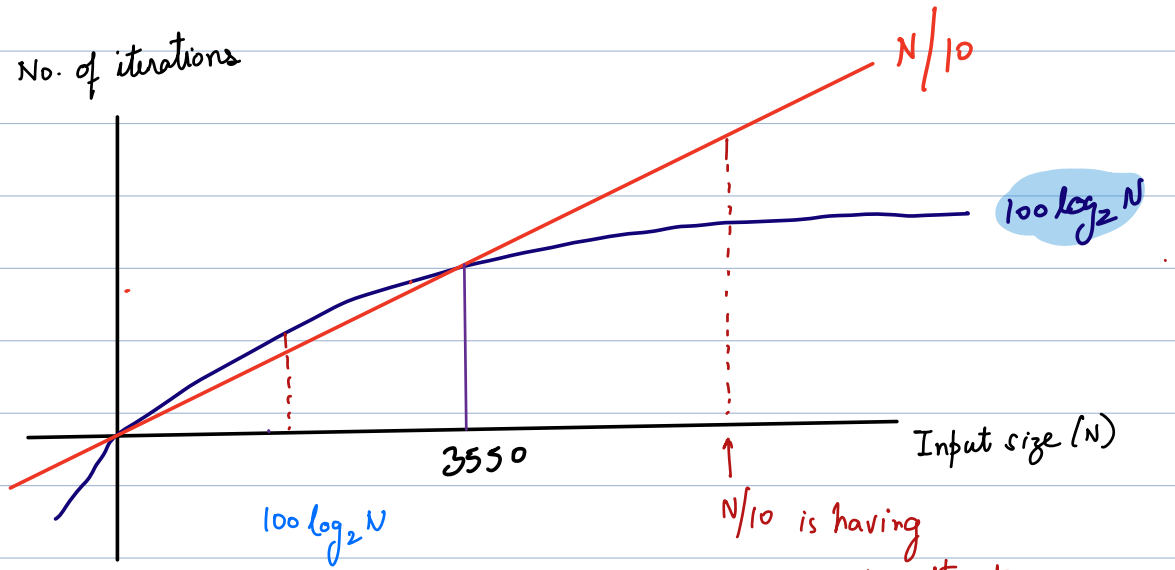
why?

Execution time depends on external factors

```
for (i = 1; i <= N; i++){        [1, N]
    print(i)
}
```

2) No. of iterations is a better metric to analyse algorithms

Aadarsh	Karan
$100 \log_2 N$	$\frac{N}{10}$
$N = 2$	
$100 \log_2 2$	$\frac{2}{10}$
100	0



below 3550 $N < 3550$

$\frac{N}{10}$ is performing better

above 3550 $N > 3550$

$100 \log_2 N$ performs better

N → Input size

2.2 Crore

Analyse algos for big values of N

Asymtotic analysis of algos

Analysing algos for big values of N

$N \to \infty$

Big O

1) Count no. of iterations
2) Take the highest order term
3) Remove constant coefficient

$N^3 + 3N^2$

$O(N^3)$

$5N + 1000$

$O(N)$

✓

$6N^2 + 3N^3 + N \times C$

↓

$O(N^3)$

$N^2 + N$ ✓ $O(N^2)$

$2N^3$ $O(N^3)$

$N^2 + \boxed{N}$

$N = 10 \rightarrow 110$ $\quad \frac{10}{110} \times 100 = 9\%$.

$N = 1000 \rightarrow 1001000$ $\quad \frac{1000}{1001000} \times 100$

$\frac{100}{1001} = 0.09\%$.

We ignore lower order terms because their contribution is negligible

$N + 10^{10}$ ✓ N^2

$N = 10^{10}$

2×10^{10} ✓ 10^{20}

100

O(1)

1000

O(1)

Issues in big O

N^2

better

$O(N^2)$

$3N^2$

$O(N^2)$

1) You cannot compare algos with same big O value

big O analysis is TC

N^2 | 10N

✓

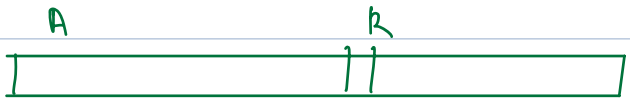
N = 3

9 | 30

Issue

2) You cannot always say that O will work for all input values of N (Might fail for smaller values of N)

{1, 2, 3, 4}



k = 1

```
bool search (A, k) {
    for (i=0; i< len(A); i++) {
        if (A[i] == k) {
            return true
        }
    }
    return false
}
```

N is len of array

TC: O(N)

worst case

10:02 – 10:15

Space Complexity

Extra space required for your algorithm

```
func (int N){
    int x;   // 4
    int y;   // 4
    long z;  // 8
}
```

int: 4 bytes

long: 8 bytes

16 bytes

SC: O(1)

```
func (int N){
    int x = N      : 4
    int y = x*x    : 4
    long z = x+y   : 8
    int arr = new int [N] : 4xN
}
```

4N + 16

SC: O(N)

N

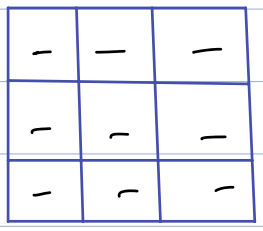
```
func (int N){
    int x = N                    4
    int y = x*x                  4
    long z = x+y                 8
    int arr = new int [N]        4N
    int [][] = new long [N][N]   8xN^2
}
```

3×3

$16 + 4N + 8N^2$

long

SC: $O(N^2)$



$8 \times N^2$

```
bool search (A, k) {
    for (i=0; i< len(A); i++) {
        if (A[i] == k) {
            return true
        }
    }
    return false
}
```

SC: O(1)

```
[] random ( N) {
    int A[N]
    for (i=0; i<N; i++) {
        A[i] = i
    }
    return A
}
```

TC: O(N)

SC: O(1)

Never count input and output of an algo while calculating SC

prefix sum array

```
int []  prefix (A, N) {                    SC: O(1)
    pref [N]
    for (i = 1 ; i < N ; i++) {
        pref[i] = pref[i-1] + A[i]
    }
    return pref
}
```

```
int []  prefix (A, N) {                    SC: O(N)
    pref [N] , pref2[N]
    for (i = 1 ; i < N ; i++) {
        pref[i] = pref[i-1] + A[i]
        pref2[i] = pref[i]
    }
    return pref
}
```

```
void  prefix (A, N) {
    pref [N]                               SC: O(N)
    for (i = 1 ; i < N ; i++) {
        pref[i] = pref[i-1] + A[i]
    }
}
```

Time limit exceeded

1) Coding contest

Q2)

Q1) ___ → TLE ☹

↓ optimize

☹

1 second → 10^8 iteration	Budget

1 GHz processor → 10^9 operations in 1 second

Constraints

$1 \le N \le 10^3$

TC: $O(N^2)$

iterations: $N = 10^3 \Rightarrow 10^6$ ✓

TC : $O(N^3)$

iterations : $N = 10^3 \Rightarrow 10^9$ ✓

Done!

$2^{10} \simeq 1024 \sim 1000$

$2^{30} = (1000)^3 = 10^9$

$i = 1$; $i * i * i \leq N$

$i^3 \leq N$

$i \leq \sqrt[3]{N}$

$[1, \sqrt[3]{N}]$

i.e. $O(N^{1/3})$
